

**Supplemental Table 2. Multivariate analysis of factors of mortality**

	<b>OR</b>	<b>95% CI</b>	<b>p-value</b>
PAD	1.67	(0.63, 4.17)	0.2813
CAD	1.56	(0.73, 3.43)	0.2559
VTE	3.33	(1.29, 8.43)	0.0112
IVDU	5.47	(1.43, 21.12)	0.012
65+	1.04	(1, 1.07)	0.0362

Age above 65 and risk factors with OR greater than 1 and p-value less than 0.2 were selected as the univariate predictors of mortality. Tobacco, alcohol, and IVDU were designated as confounders to consider for this multivariate analysis. Multivariate regression was performed for the respective p-values to determine how coexistence of PAD, CAD, VTE, IVDU, 65+ and confounders tobacco, alcohol, and IVDU affected mortality.

IVDU, intravenous drug use; CAD, coronary artery disease; PAD, peripheral arterial disease; VTE, venous thromboembolism including deep venous thrombosis and pulmonary embolism; 65+, age above 65 years.
